01. Base map scanning and Editing

03. Elevator area deployment

05. Prohibited line deployment

07. Vending machine deployment

02. Target point setting

04. Set point position

06. Scheduling deployment

PART 1

Base map scanning and editing

Base map scanning and editing

1.1 The base map must be scanned completely, and the places that are not visited must also be filled in

1.2 The guest room must be scanned with the door closed (the scene when resuming normal work)

1.3 Movable objects (flower pots, trash cans, linen carts, chairs, noise points, etc.) must be erased (increase the robot's operational area)

1.4 The reflective points on the glass and mirror positions in the base map corridor do not need to be erased (increase the robot's positioning effect)

【 If there is mirror light on the running path, it will be scanned as it is, and there is no need to erase it (if the reflective length exceeds 2M, sandpaper needs to be pasted and scattered laser noise needs to be erased)】

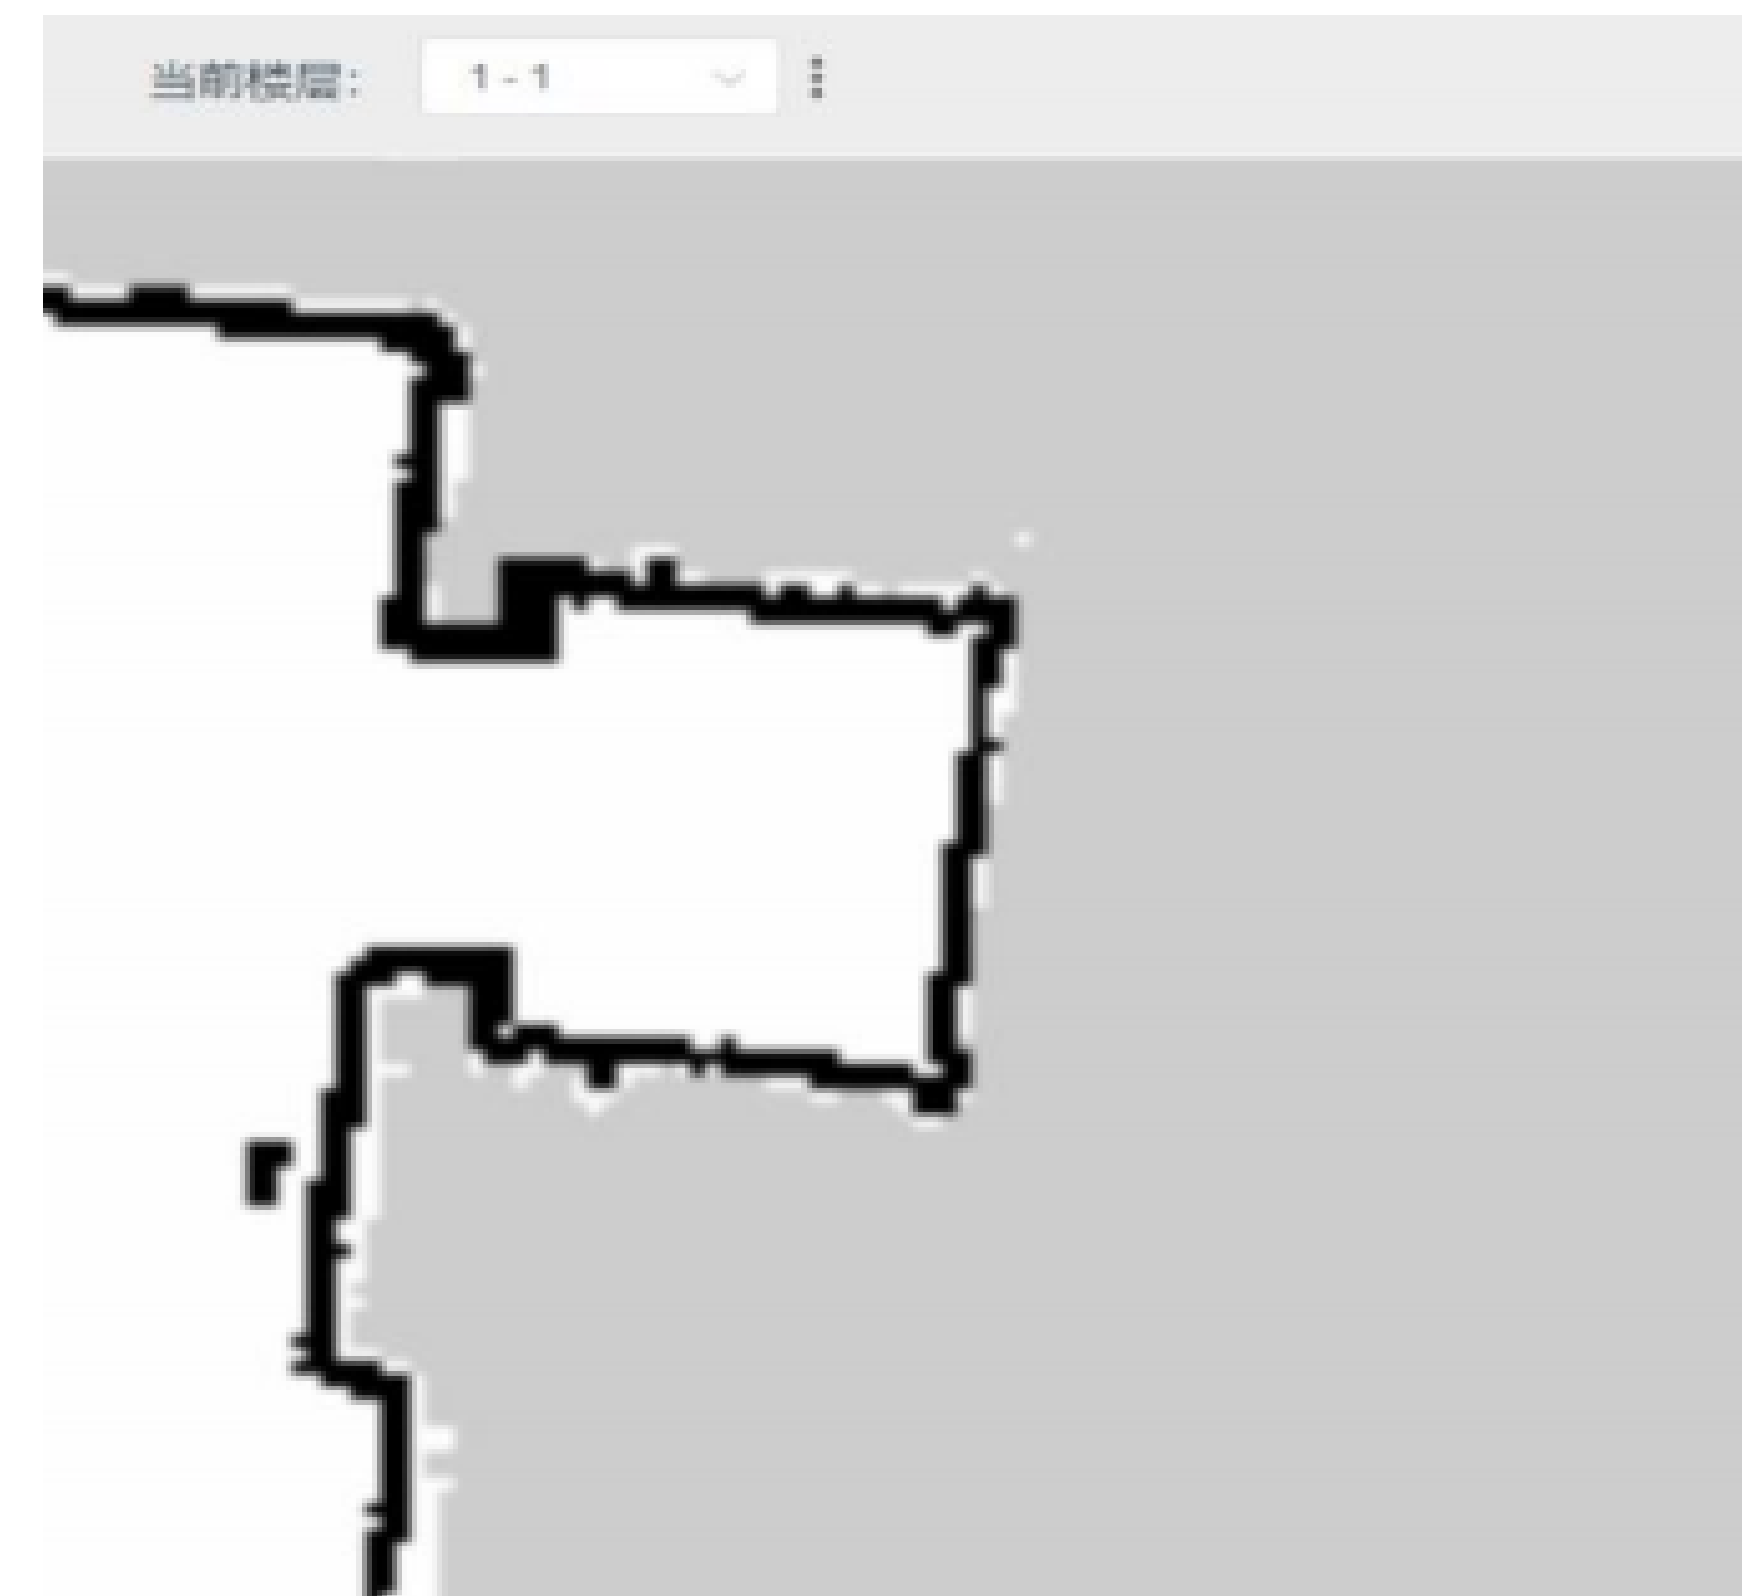

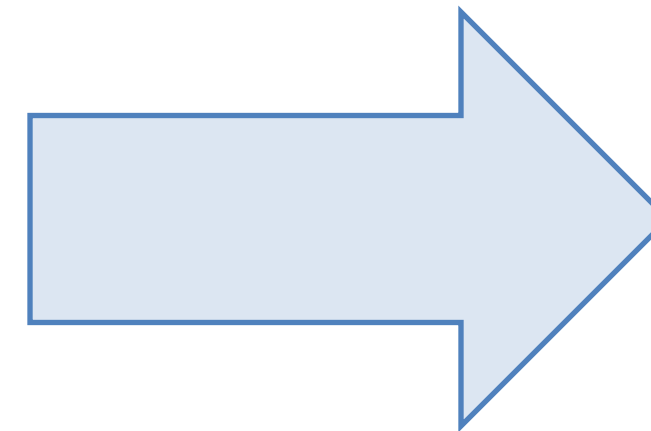

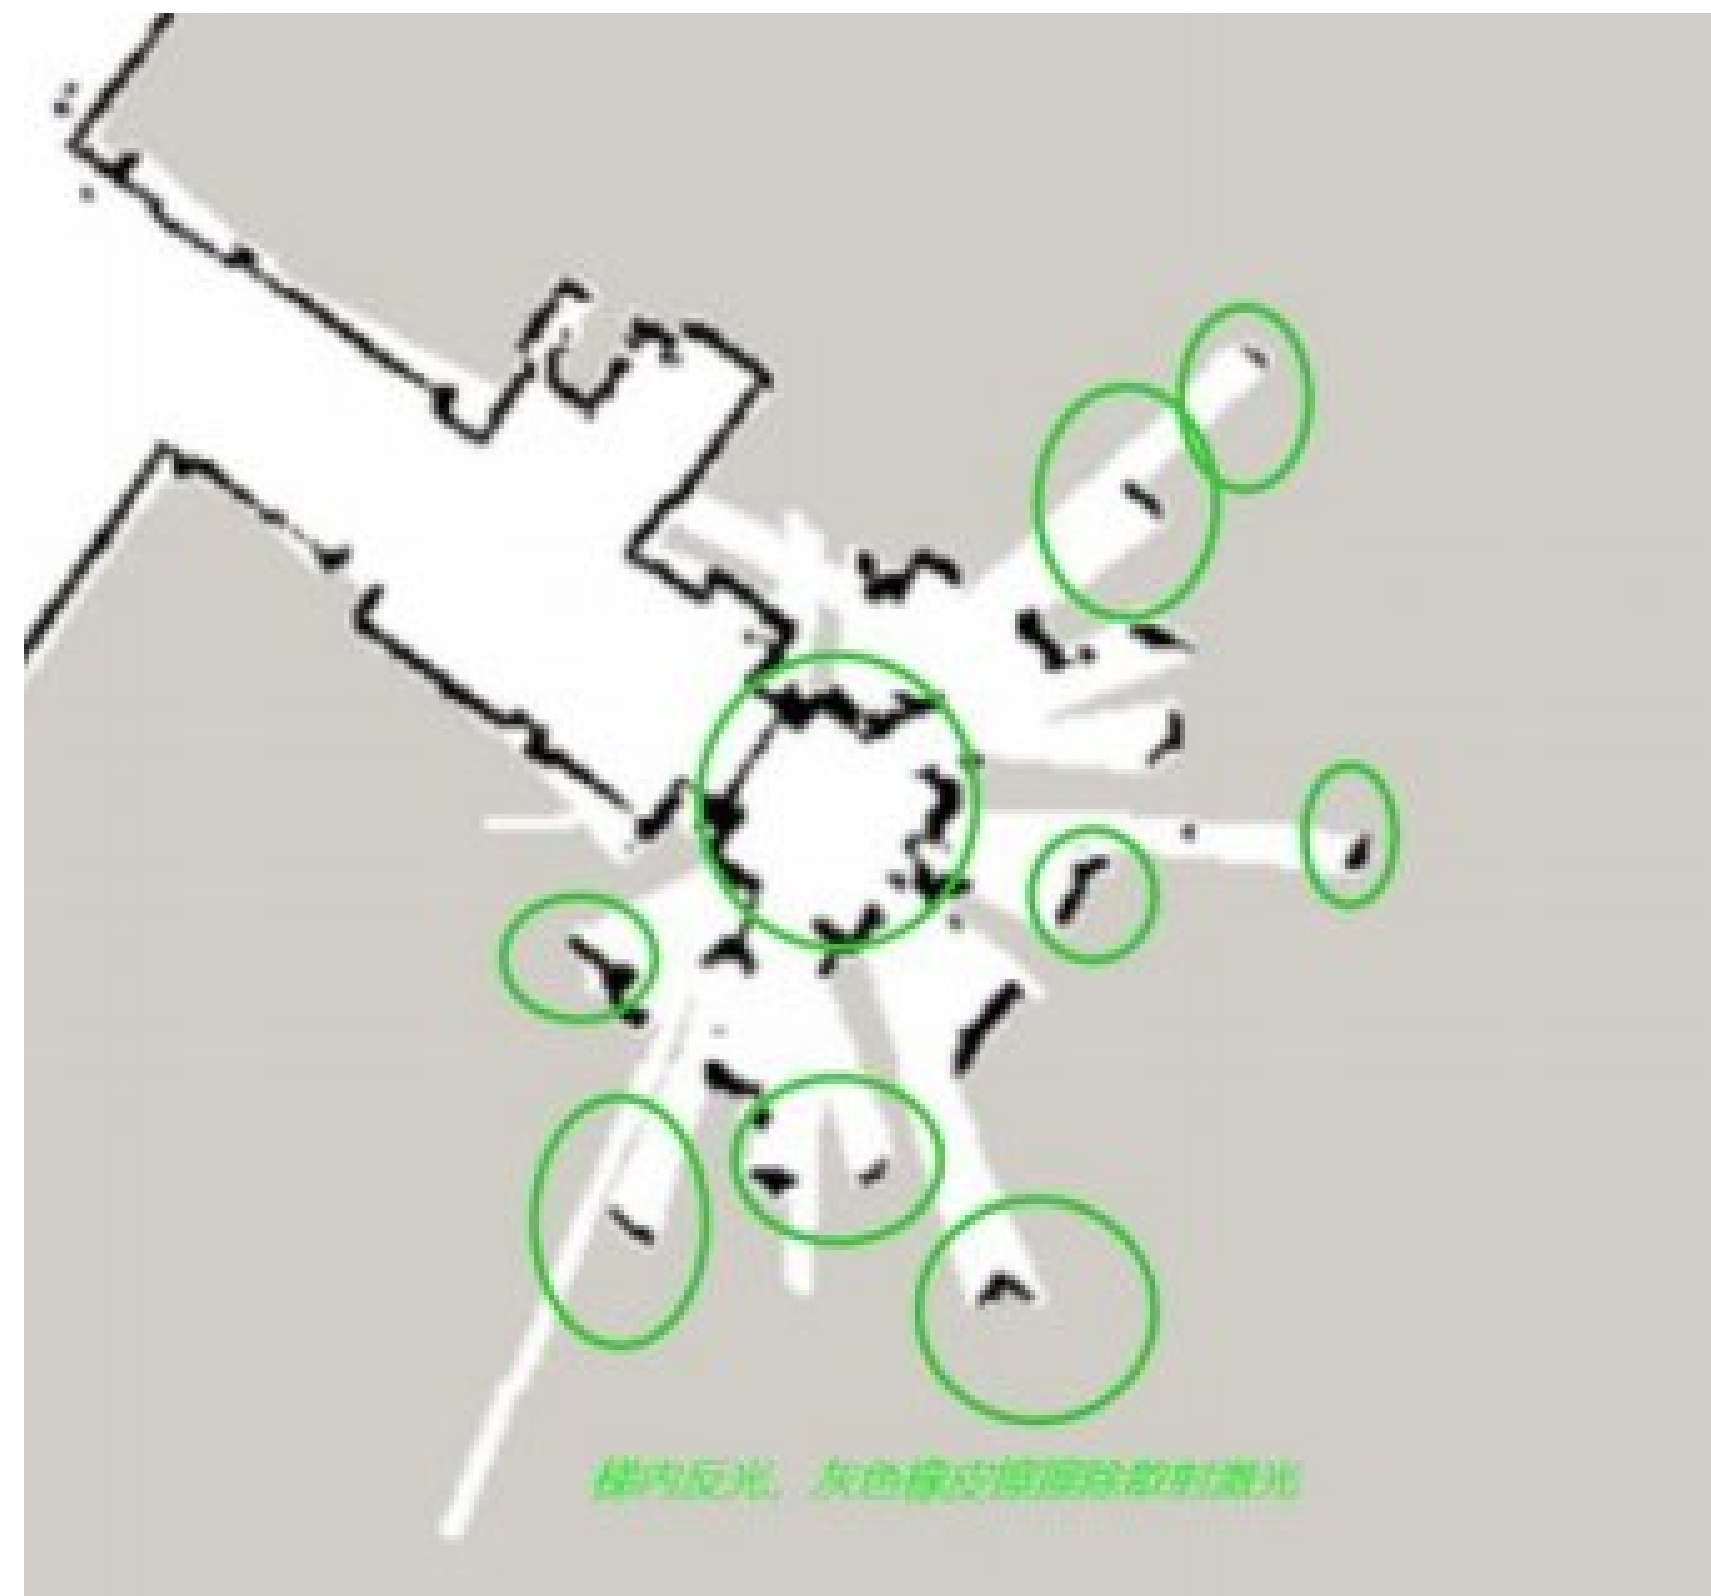

Manually erase the area where the door is not closed and add to the base map

Base map scanning and editing

1.5 The large area of reflective noise in the elevator base map is erased and the elevator frame is filled in. The customer is required to apply film.

Operate as shown in the figure below

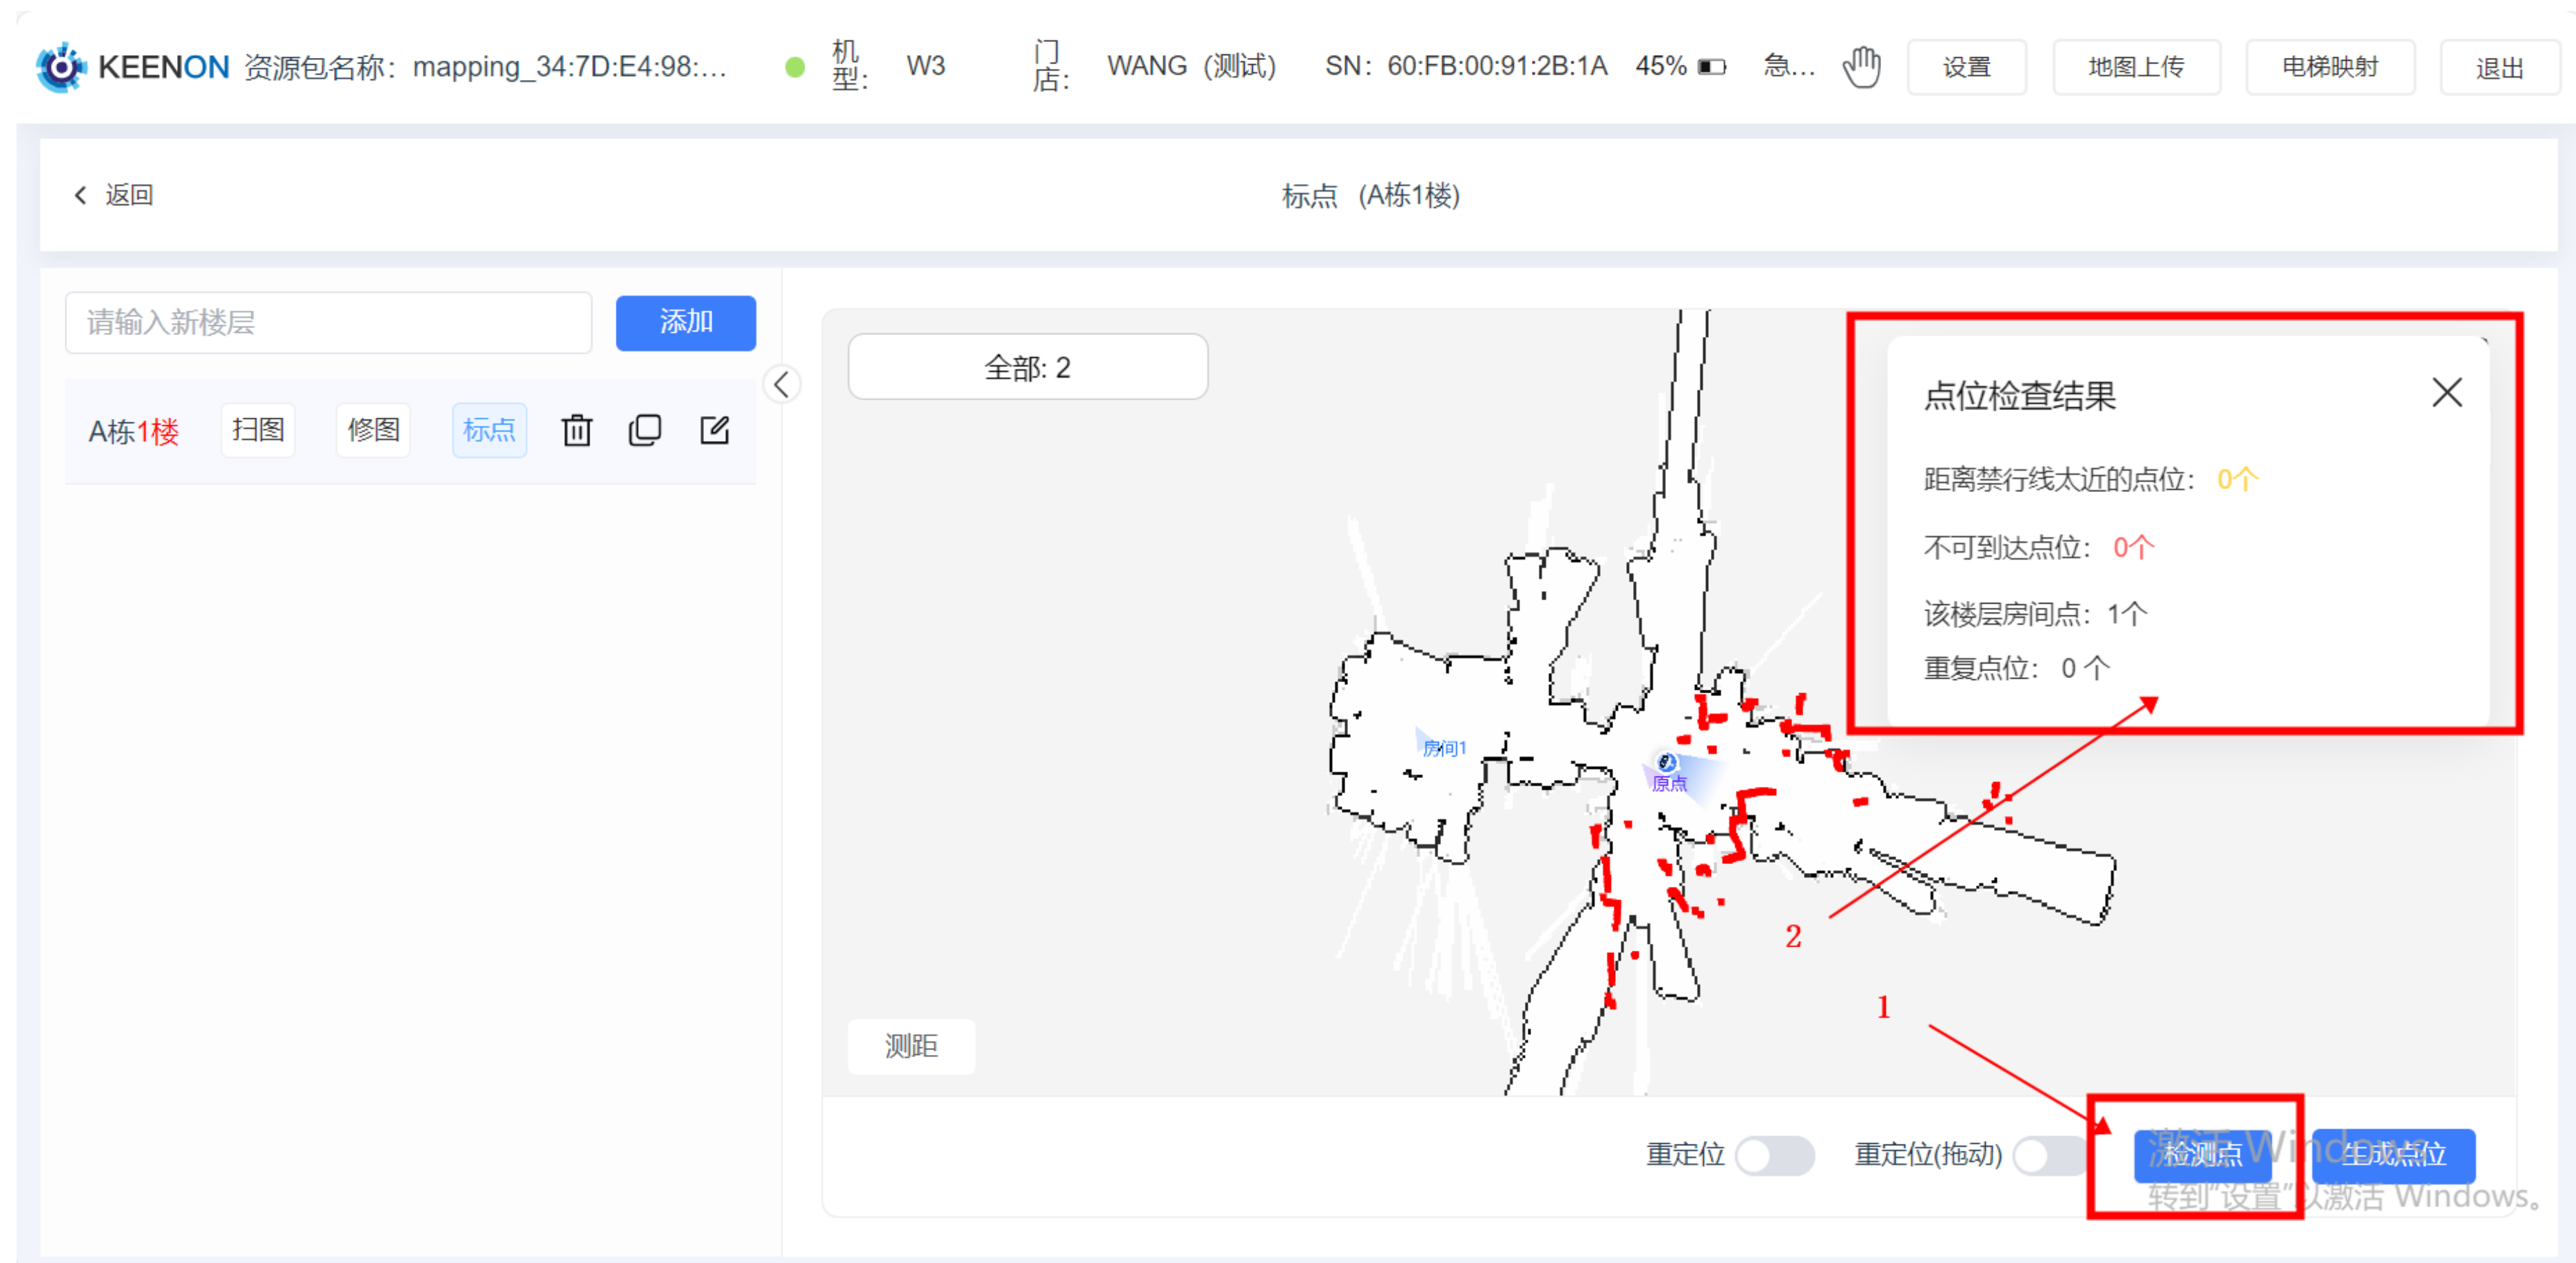

PART 2

Target point setting

Target point setting

2.1 The distance from the wall/object should be no less than 15cm, and the name cannot have spaces. (Excluding elevator points)

2.2 After the point is placed, click the detection point to check whether the point is placed reasonably

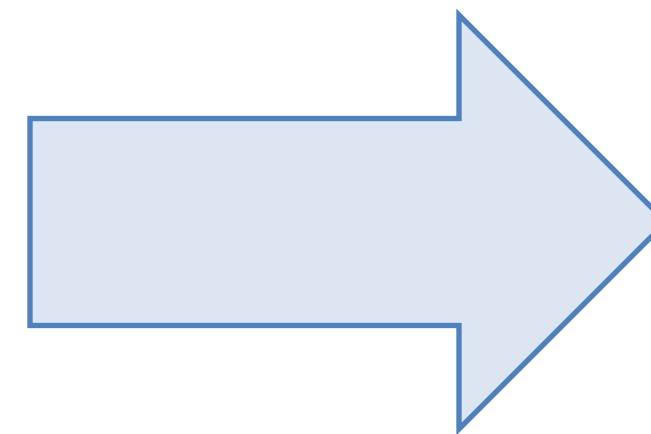

PART 3

Elevator Area Deployment

Elevator area deployment

3.1 Expand the door frame boundary of the elevator area, and do not widen the base map. If the two sides of the elevator are different, you need to widen the short side to make it consistent with the other side, so that the middle of the boundary is in the middle of the actual elevator entrance.

PART 4

Set point position

Set point position

4.1 Set an interior point in the elevator facing the elevator door, and the distance from the fuselage boundary to the elevator door is 20-30cm;

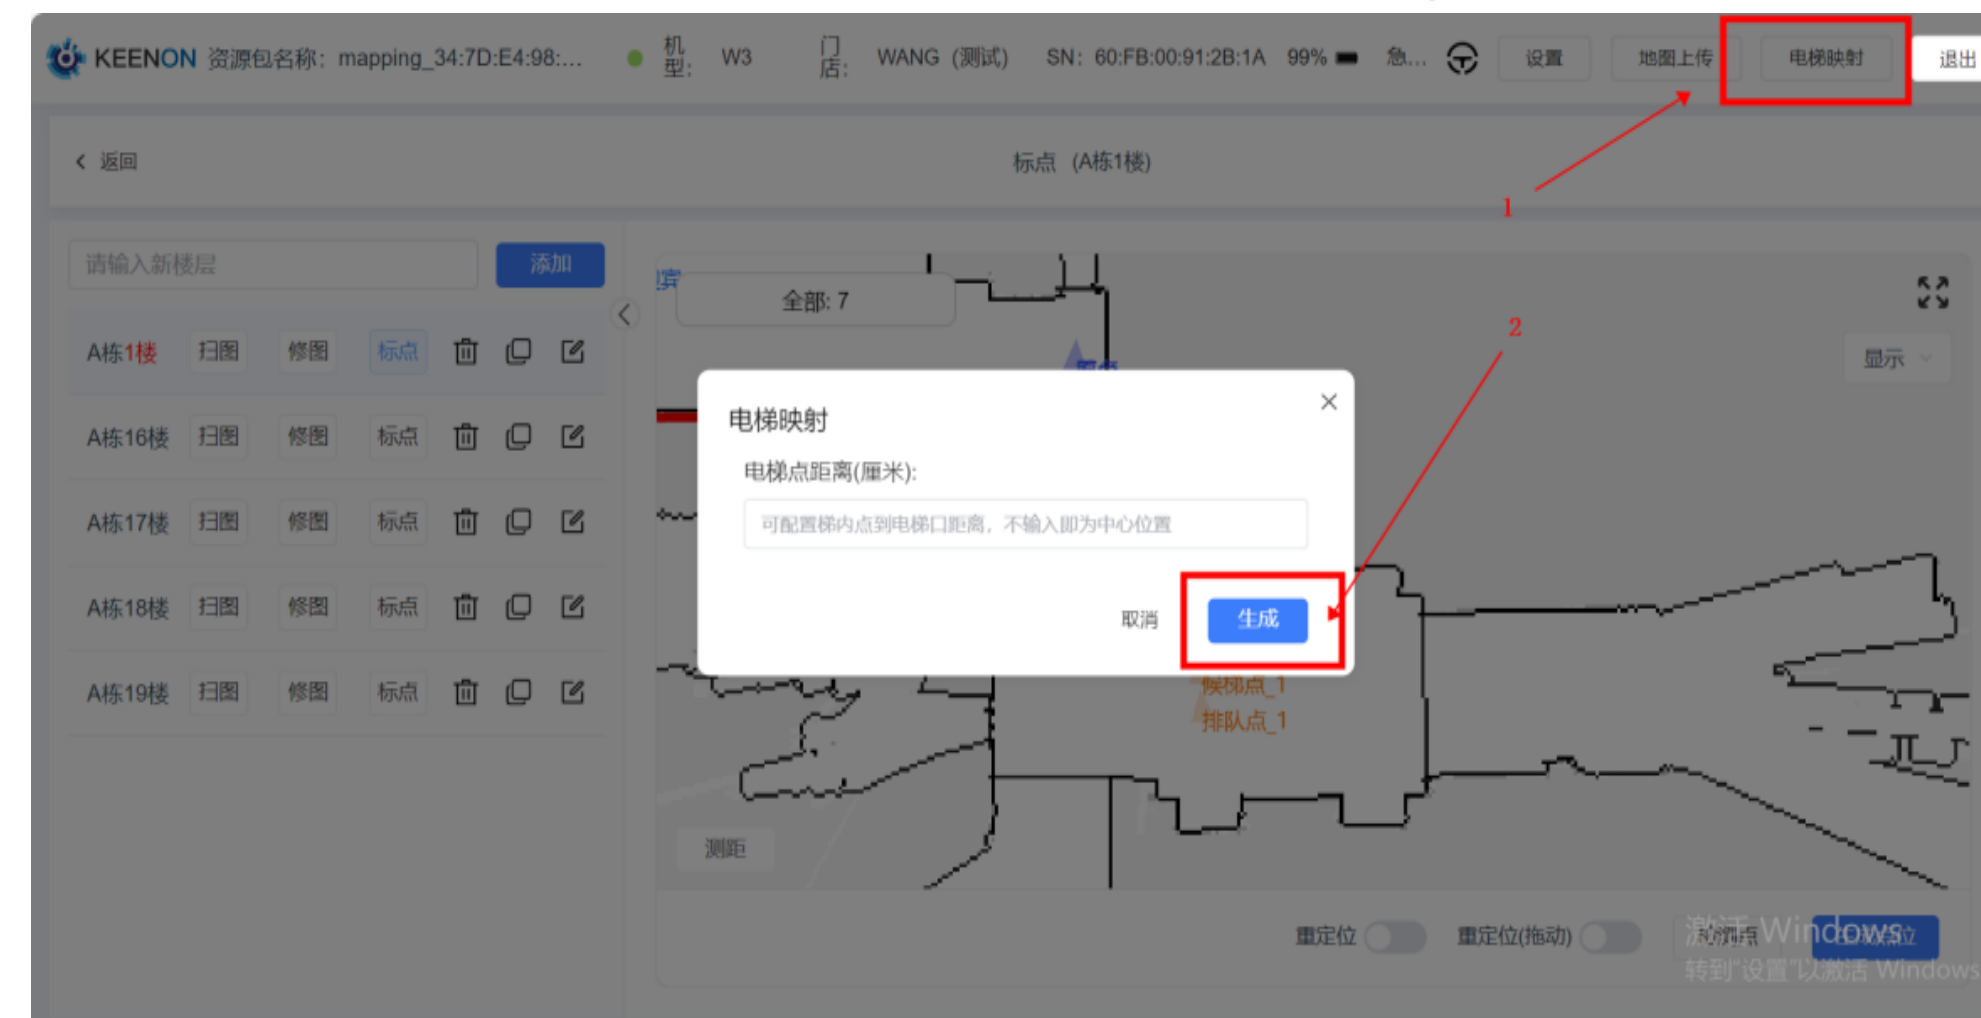

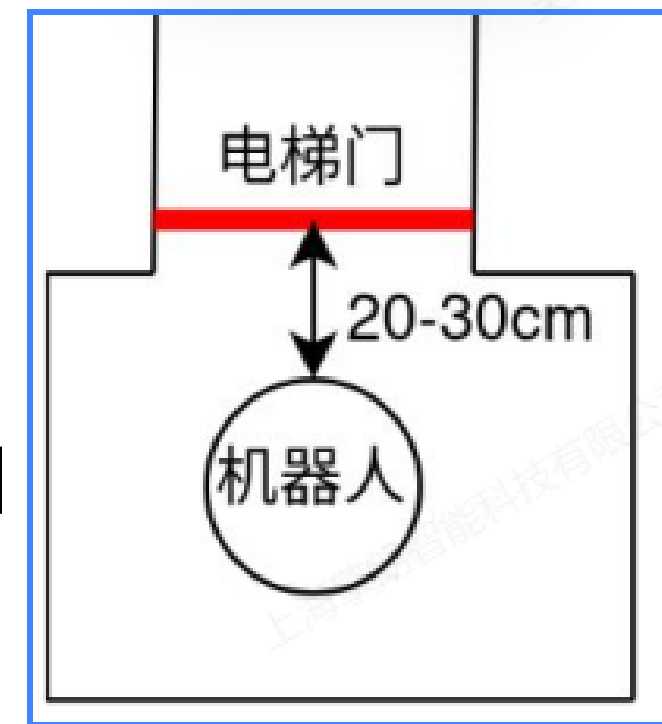

4.2 The distance between the waiting point and the elevator entrance must be greater than 0.6m and less than 1m

4.3 The distance between the queuing point and the waiting point must be greater than 0.6m

4.4 You can place the obstacle avoidance point nearby, and the distance from the queuing point to the waiting point is greater than 0.6m (it also needs to be set up for a single robot)

4.5 Click the elevator mapping button to generate elevator mapping (not available overseas)

4.6 For double-door elevators, the door frame area must be drawn on the elevator part (SW and CW mixed use venues must be set up)

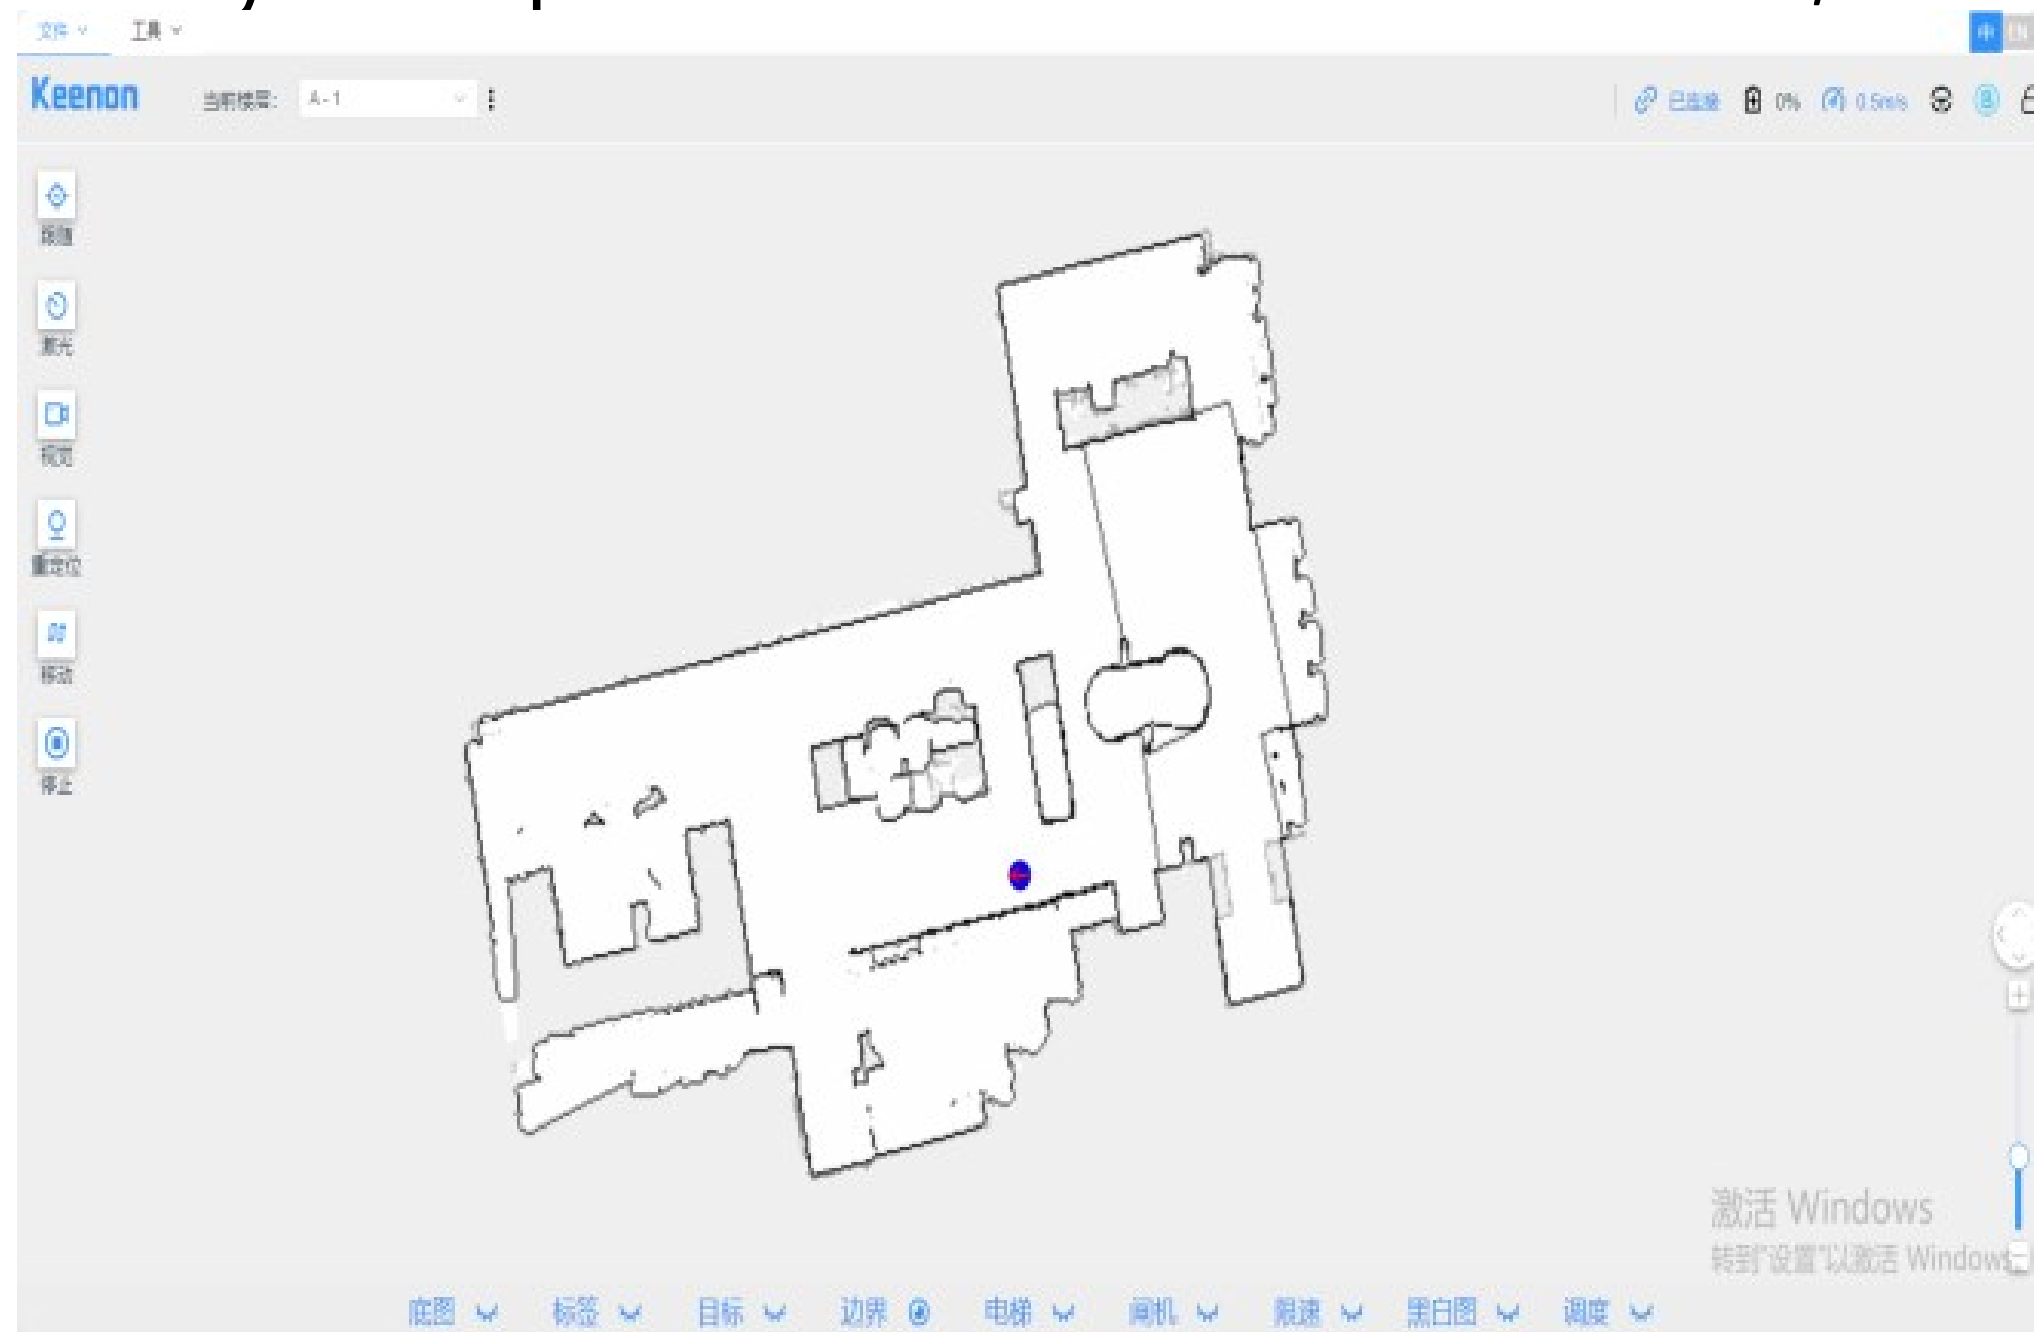

PART 5

Restriction Line Deployment

Restriction Line Deployment

5.1 Add no-go lines in risky areas [ground height difference, suspended objects (not visible by stereo vision/radar), risk of falling, etc.]

5.2 Try to expand the customer use area, and try not to draw no-go lines in risk-free areas

PART 6

Scheduling deployment

Scheduling Deployment

The schedule path must be automatically generated (no modification of path points is allowed, and no avoidance points need to be added)

PART 7

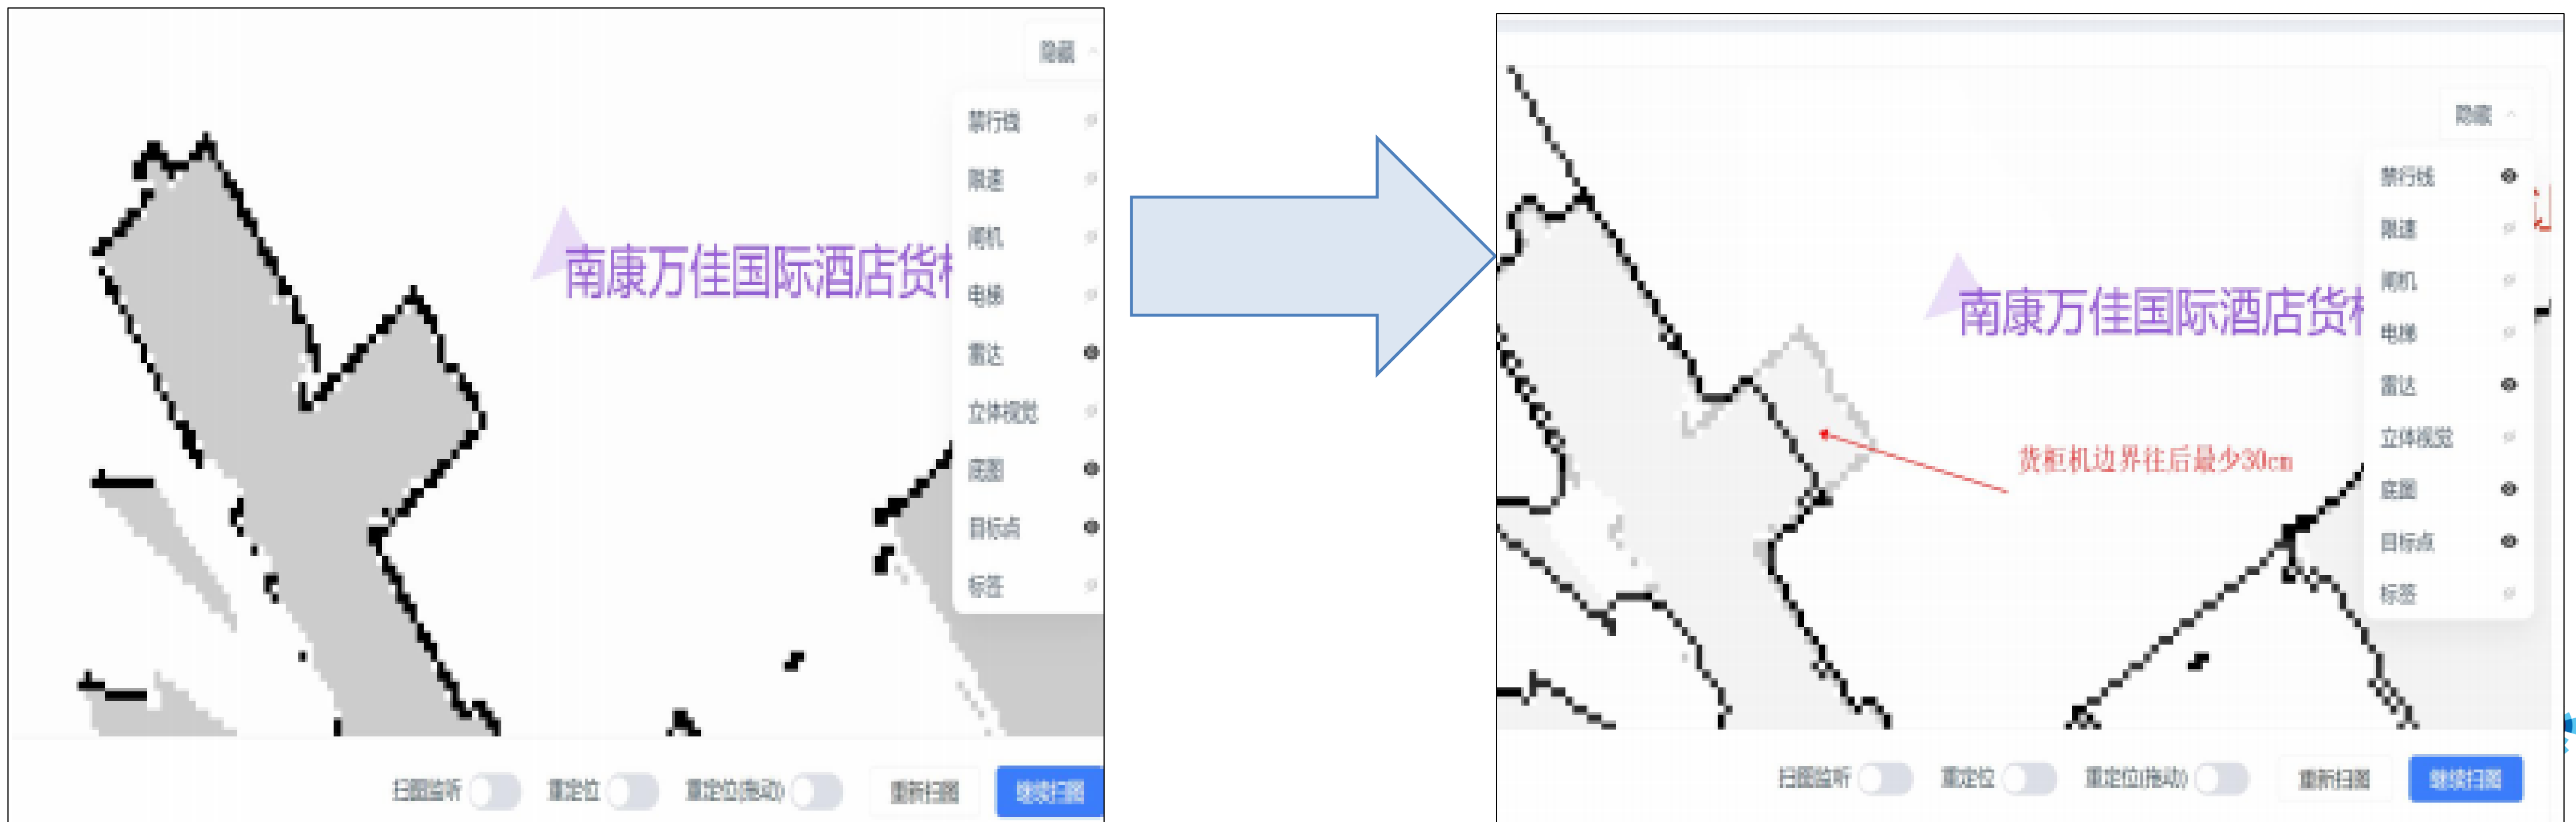

Vending Machine Deployment

Vending Machine Deployment

7.1 The vending machine boundary needs to be at least 30cm back, and the vending machine point name must be consistent with the backend vending machine name

7.2 The target_id must be changed to be consistent with the room number, and the Chinese point is entered according to the target_id. Room number (function path: [Settings-Advanced Settings-Batch Modify Target Points](#))

7.3 After the map is created, it must be uploaded to the cloud

Vending Machine Deployment
